Building foundations for lifelong interrogative skills

At AM, we are trying to bring the principles of humanism to our approach to technology.

We are building foundations for its transformative possibilities for interpretation and interrogation of sources, improving metadata, transcribing difficult scripts, providing multilingual translation.

But we give much consideration to how to balance this against the need to retain and promote the traditional thought processes of a humanities education.

Critical, speculative, creative and interpretive.

Those skills are what we deliver as much as the sources themselves.
